

► **Figure 50.27 The sliding-filament model of muscle contraction.** The drawings on the left show that the lengths of the thick (myosin) filaments (purple) and thin (actin) filaments (orange) remain the same as a muscle fiber contracts.

▼ **Figure 50.28 Myosin-actin interactions underlying muscle fiber contraction.**

? When ATP binds the myosin head, what prevents the filaments from sliding back into their original positions?
