

Make Connections

Questions in every chapter ask students to relate content to material presented earlier in the course.

CONCEPT CHECK 24.2

1. Summarize key differences between allopatric and sympatric speciation. Which type of speciation is more common, and why?
2. Describe two mechanisms that can decrease gene flow in sympatric populations, thereby making sympatric speciation more likely to occur.
3. **WHAT IF?** Is allopatric speciation more likely to occur on an island close to a mainland or on a more isolated island of the same size? Explain your prediction.
4. **MAKE CONNECTIONS** Review the process of meiosis in Figure 13.8. Describe how an error during meiosis could lead to polyploidy.

For suggested answers, see Appendix A.

Make Connections: Kidney Function and Passive and Active Transport

The human kidney produces highly concentrated urine through the passive and active transport of NaCl , urea, and water. Click on the figure at left to review passive and active transport. Click on the figure at right to review how urine concentration occurs in the nephron. The concentration of urine in the kidney is an important adaptation to a terrestrial existence.

Make Connections Tutorials

connect content from two different chapters using art from the book. Make Connections Tutorials are assignable and automatically graded in Mastering Biology and include answer-specific feedback for students.
