

▼ **Figure 28.19** Structure and function in the ciliate *Paramecium caudatum*.

(a) Feeding, waste removal, and water balance

(b) Conjugation and reproduction

MAKE CONNECTIONS The events shown in steps 4 through 6 of this diagram have a similar overall effect to what event in the human life cycle (see Figure 13.5)? Explain.

means of **pseudopodia**, extensions that may bulge from almost anywhere on the cell surface. An amoeba moves by extending a pseudopodium and anchoring its tip; more cytoplasm then streams into the pseudopodium. Amoebas do not constitute a monophyletic group; instead, they are dispersed

across many distantly related eukaryotic taxa. Most amoebas that are rhizarians differ morphologically from other amoebas by having threadlike pseudopodia. Rhizarians also include flagellated (non-amoeboid) protists that feed using threadlike pseudopodia.
